DS Dash: Voice Transcription Services: AI driven legal transcription software that works

DS-Compliance, a leading developer of applications for compliance has launched a new AI based voice transcription service that overcomes many of the drawbacks that affect existing transcription software.

Forming part of DS Dash suite and dashboard, the new transcription service works across numerous languages with the capability to distinguish keywords and phrases as well as cutting through issues such as background noise and poor sound quality that can often present challenges where accuracy is essential.

DS-Compliance is currently focused on the need for transcription for legal discovery work, having been trialled by legal teams for matters including time sensitive GDPR reporting. Key features are as follows:

Allows for a quick build dictionary

Implementation is accelerated through the compilation of a dictionary of key words and phrases that are being sought, to in effect speed up the AI based learning process which remains ongoing.

Fast implementation with multi-format capability

Options range from cloud or in-house server hosting and the software accepts most formats of sound files.

Distinguishes between multi-speaker audio recordings

Speaker tone and pronunciation is carefully monitored to separate speakers' dialogues to avoid blocks of transcription that might otherwise require post transcription editing.

Colour coded transcription by speaker

Transcription output is quickly analysed and cross referenced to the original audio files, minimising downtime and maximising productivity. Keywords and phrases are also highlighted.

High processing rate

Time availability is critical; audio files are turned around in a few moments depending on volumes.

Cloud based API links

Integrate with existing or new workflows and software, DS Dash: Voice Transcription Service meets all requirements via the cloud or through server based set up.
